SurveyUSA® of Verona NJ created this chart and is responsible for its contents. Error is calculated using the "Mosteller 5" Measure, which works this way: If "Pollster A" says Smith beats Jones by 8 points, and in fact Smith beats Jones by 5 points, then Pollster A has an "error" of 3 [8 minus 5]. A 3 would be recorded in the table above for that contest. There are limitations to this and all other measures of pollster accuracy. For a complete discussion of the different ways that election poll accuracy can be measured, including a summary of all 8 known measures, see the following paper presented at the 2006 conference of the American Association for Public Opinion Research: <http://www.surveyyusa.com/ShipmanElectionPollAccuracy.html> All pollsters and timely polls of likely voters included in this table; no timely polls of likely voters intentionally excluded. Report errors or omissions to editor@surveyyusa.com. Additional pollster Report Cards, from 2008 and from earlier elections, using this and other error criteria, available at SurveyUSA homepage, www.surveyyusa.com 1-800-786-8000.
